

IN THE CLAIMS AMEND

1. (Currently Amended) A bag apparatus capable of being releasably attached to an outside object, the bag comprising:

- a container having;

- a front surface and a back surface, the front and back surface sealed to each other to define a substantially fluid-tight cavity, the front surface including an opening;

- a fitment ~~associated with~~ attached to the front surface of the container substantially corresponding to the opening of the front surface, ~~the fitment in fluid communication with the fluid-tight cavity;~~

- a suspending assembly for suspension from ~~an~~ a separate outside object, the suspending assembly comprising at least one hang tab including:

- a front surface and a back surface, each having a first portion and a second portion, one of the first portion and the second portion of the back surface adhered to one of the front and back panels of the container, defining an adhesive edge; and

- a receiver assembly associated with the other of the first portion and the second portion, the receiver assembly comprising a slot capable of ~~facilitating the~~ attachment to ~~an~~ a separate outside object,

wherein the at least one tab is attached to the respective surface such that the adhesive edge is spaced apart from an upper edge of the container, whereupon suspension of the container from a separate outside object by way of the suspending assembly, the adhesive edge becomes the effective top end of the container and the fitment becomes positioned substantially proximate the effective bottom of the container.

2. Cancelled.

3. The bag apparatus of claim 2 1 wherein the at least one hang tab is positioned such that the entirety thereof overlies a portion of the one of the front panel and the back panel to which it is attached.

4. The bag apparatus of claim 1 wherein the at least one hang tab comprises a pair of hang tabs, the pair of hang tabs spaced apart from each other.

5. The bag apparatus of claim 4 wherein each of the hang tabs is substantially identical.

6. – 9. Cancelled.

10. (new) A bag apparatus capable of being releasably attached to an outside object, the bag comprising:

- a container having;
 - a front surface and a back surface, the front and back surface sealed to each other by way of a top seal, a bottom seal, a first side edge and a second side edge, the surfaces and the seals combining to define a cavity; and
 - an opening extending through the front surface, the opening is substantially equidistantly spaced apart from the first side edge and the second side edge, and positioned substantially closer to the bottom seal than to the top seal;

- a fitment attached to the front surface of the container proximate opening of the front surface;

- a suspending assembly for suspension from a separate outside object, the suspending assembly comprising a pair of spaced apart hang tabs, each tab is attached to the back surface closer to the top seal than the bottom seal, a first of the pair of spaced apart hang tabs positioned closer to the first side edge than the opening and a second of the pair of spaced apart hang tabs positioned closer to the second side edge than the opening, each hang tab includes:

- a front surface and a back surface, each having a first portion and a second portion, the second portion adhered to the back surface and terminating at an adhesive edge; and

- a receiver assembly associated with the first portion, the receiver assembly comprising a slot capable of attachment to a separate outside object,

wherein the adhesive edge is spaced apart from the top seal of the container, such that upon suspension of the container from a separate outside object by way of the suspending assembly, the adhesive edge of the pair of tabs becomes the effective top end of the container and the fitment becomes positioned substantially proximate the effective bottom of the container.

11. (new) The bag apparatus of claim 10 wherein the pair of hang tabs are positioned equidistant from the respective side edge to which the respective hang tab is closest.

12. (new) The bag apparatus of claim 11 wherein the first portion and the second portion of each hang tab is substantially identical.

13. (new) The bag apparatus of claim 11 wherein each hanging tab comprises a woven material laminated between polyethylene.

14. (new) The bag apparatus of claim 11 wherein each hanging tab comprises a tear strength which is higher than a tear strength of the container.
